Dilue Card

Novuma is a ready-to-use product !
The application is explained in detail in the instructions for use.

If it will be used by dilution;
The dilution solution (local anesthetic drug and physiological saline) is drawn into another steril luer-tipped syringe (5cc-10cc) at a ratio of 1:1 or 1:2, depending on the application.

A sterile connector is placed on the tip of the luer syringe containing the dilution solution, and Novuma syringe is attached to the other end of the connector.

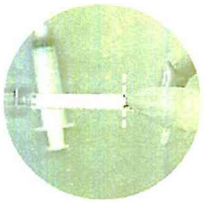

After transferring the Novuma product into the syringe containing the dilution solution, the Novuma syringe is removed.

Another sterile luer syringe (5cc-10cc) is attached to the end of the connector. The mixture is transferred from one syringe to the other one at least 15-20 times, until it becomes homogeneous.

After obtaining a homogeneous mixture, diluted Novuma is transferred to its own syringe. Pay attention to not to exceed the 1.5cc mark on the Novuma syringe during transfer.

Application is made in accordance with the procedure in the instructions for use in the box. You can reach the preparation video with QR Code
